Section: 0W1
Programming Assignment: 02

These two programs filecnt and filedisp will display the number of directories, files or number of bytes occupied of a given directory by the user. It should be used together via a "pipe" so the user can choose the specific details that he or she wants to know.

1. Open a terminal window in Linux

2. Make sure you have the two files filecnt and filedisp in your current working directory.

3. Use the following command
      ./filecnt *directory* | ./filedisp *-f/-d/-b*

      "./filecnt", "./filedisp": execution of filecnt and filedisp programs
      directory: absolute path of the directory you want to get information about. Absolute path can be obtained through the command "pwd" when you have that directory as current working directory.
      -f/-d/-b: options for filedisp program
           -f means to display number of files only
           -d means to display number of directories only
           -b means to display number of bytes occupied only

4. Result will appear on the terminal window
